Education

Expected 2028 **B.Tech in Computer Science Engineering (AI/ML Specialization)**
Sandip University Current: 4th Semester

Technical Skills

Languages	Python (Advanced)
AI/ML & Data Science	PyTorch, MediaPipe, NumPy, Pandas, Local RAG, Vector Embeddings
Backend & APIs	FastAPI
Systems & Design	Relational Database Schema Design, UML Architecture, Document Indexing Pipelines

Professional Experience

May 2026 – Present **AI/ML Engineering Intern** — *Oasis Infobyte* Remote

- Engineered Python-based data processing scripts that accelerated internal data pipeline throughput, delivering production-ready solutions aligned with team sprint objectives.
- Implemented ML-driven analytical modules to surface data-driven insights, directly supporting decision-making workflows across active project deliverables.

Technical Projects

Python, Computer Vision, FastAPI, SQL **UniShield — Automated Gate Entry & Campus Security System**

- Architected a real-time automated face recognition system for campus entry management, designing full relational database schemas and UML diagrams that reduced manual security overhead for Sandip University edge deployment.
- Engineered end-to-end backend API logic using FastAPI, enabling sub-second identity verification throughput validated through live on-campus testing cycles.

Python, Local LLMs, Vector DB, Parsing **Incite — Privacy-First Local RAG System**

- Built a fully local Retrieval-Augmented Generation pipeline achieving 100% data privacy and zero cloud API cost by eliminating external LLM dependencies via local model inference.
- Designed scalable document indexing and vector embedding workflows that enable semantic search over private internal datasets with no data exfiltration risk.

Python, MediaPipe, Computer Vision **Drishti — AI Fall Detection System for Elderly Care**

- Developed a real-time pose estimation system using MediaPipe skeleton tracking to detect fall events in elderly individuals, engineering spatial coordinate logic that accurately flags sudden vertical velocity drops.
- Reduced false positive alerts by implementing multi-landmark delta thresholding, improving system reliability for continuous, unattended monitoring deployments.
